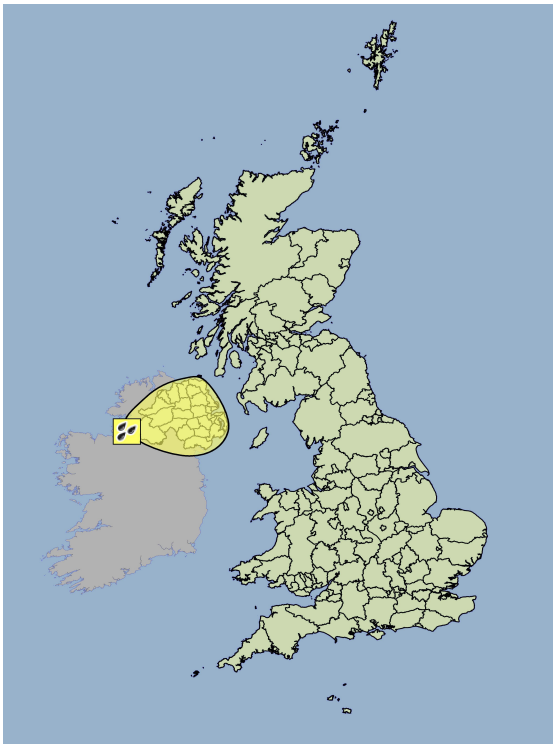
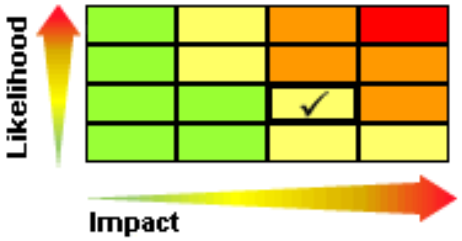
National Severe Weather Warning Service





Chief Forecasters Assessment
A developing frontal system is expected to move slowly east across Northern Ireland during Thursday bringing with it a band of persistent and heavy rain. 20-40 mm of rain is expected to fall widely with as much as 60 mm over south facing hills. The rain will be accompanied by southerly gales, particularly in exposed parts of the east.

There is also the potential for a second pulse of heavy rain, giving another 15-30 mm, to move north overnight and early Friday although confidence is low in the detail at this stage.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **10:00 on Thu, 13th Nov 2014** until **10:00 on Fri, 14th Nov 2014**

A developing frontal system is expected to bring another period of persistent, and at times heavy rain to Northern Ireland during Thursday and into Friday. The rain is likely to be accompanied by gales during Thursday with gusts of 60 mph in exposed parts of the east.

Following recent wet weather, the public should be aware of the continuing risk of flooding from this next batch of heavy rain.

This is an update to the Alert issued on Tuesday and it will be kept under review with the possibility of escalating to Amber on Thursday morning, should the likelihood of medium impacts increase.
